

GoPackNow

Monetization Plan

June 2026

A per-trip monetization strategy built around GoPackNow's core mechanic: propose, vote, lock in, AI synthesizes. Every pricing decision protects the group coordination loop that makes the product unique.

Pricing Philosophy

GoPackNow is a group product. The moment you paywall any part of the group flow, one person's unwillingness to pay blocks the entire group from using the app. That kills adoption faster than almost anything else in group software.

The solution: the host pays once, the whole group benefits. This makes the organizer the buyer (they have the most pain and motivation), eliminates the "3 of 5 friends won't pay" problem, and turns every invited free member into a future host who already understands the product.

Per-trip pricing matches how people think about trip spending. \$14.99 feels like nothing when you're budgeting hundreds or thousands for the actual trip. It avoids subscription churn ("do I still need this?") and creates a clean value exchange: one payment, one trip, done.

Tier Structure

Tier 1: Free Group Plan

The free tier exists to let every group experience the full core loop once. Invited members become future customers. This is the growth engine.

- Join Packs via invite link or trip ID
- Up to 5 members per trip
- Add and vote on wishes (full voting and lock-in flow)
- Submit destination preferences
- One destination suggestion round (3 AI suggestions, group votes)
- Accommodation link voting (member-submitted links, AI parses and summarizes)
- Real-time group chat
- One basic AI itinerary generation
- One redo per AI feature (destination, activity, packing list)
- Basic packing list generation
- Open in Maps per activity

Note: The free tier lets groups of up to 5 experience the full core loop with one generation and one redo per AI feature. This is enough to demonstrate the product's value while creating clear upgrade triggers for larger groups or heavier AI usage.

Tier 2: Pack Plus

\$14.99

One payment from the host. Unlocks premium for the entire group.

This is the primary product. The upgrade message should be simple and direct:

"Upgrade this Pack for \$14.99 -- one payment unlocks premium planning for everyone on this trip."

- Additional destination suggestion rounds (re-run with new preferences or feedback)
- Full accommodation AI comparison (Claude summarizes and compares submitted listings)
- Up to 20 AI activity redos (swap, regenerate, refine)
- Unlimited packing list regenerations
- Advanced itinerary regeneration with freeform group feedback
- Text share of itinerary via native share sheet
- Add to Google Calendar per activity
- Styled PDF export (branded cover, member list, day-by-day, cost summary)
- Personalized packing lists (tailored to destination, duration, vibes, budget per member)
- Offline itinerary access
- Route optimization between activities
- Larger group support (up to 20 members)
- Priority AI generation (faster response times)

At \$14.99 revenue against approximately \$0.15 in AI costs per trip, gross margin is ~99%. After Apple/Google's 15% small business commission, net revenue per trip is approximately \$12.74. Margin remains excellent.

Tier 3: Solo Pass

\$9.99

Per trip. Personal concierge-level planning for individual travelers.

Solo travelers have many free alternatives, so this must feel like a personal concierge, not group mode with voting stripped out. Deprioritize building this until real demand is validated from users requesting it. Do not launch alongside Pack Plus.

- Personalized destination selection based on individual preferences
- Complete AI itinerary tailored to solo travel patterns
- Accommodation suggestions with AI comparison
- Ten AI activity redos
- Personalized packing list
- Styled PDF export
- Offline access

Tier 4: GoPack Pro

\$49.99 / year

For frequent travelers. Launch only after repeat purchase behavior is proven.

Competitive with Triplt Pro at \$49/year. Do not launch until you have data showing users purchasing Pack Plus for a second or third trip. This tier converts repeat buyers into subscribers.

- Unlimited premium group and solo trips
- Saved traveler profiles (preferences persist across trips)
- Increased destination and activity regeneration limits
- Personalized packing profiles that learn over time
- Offline access on all trips
- Premium styled exports on all trips
- Priority AI generation

Important: Use unlimited trips with reasonable per-trip AI usage caps rather than a fixed trip count (e.g., "5 premium trips"). Power users paying \$50/year should not have to ration which trips they use their Pro benefits on.

Tier Comparison

Feature	Free	Pack Plus	Solo Pass	Pro
Price	Free	\$14.99/trip	\$9.99/trip	\$49.99/year
Who pays	--	Host only	Individual	Individual
Group benefits	--	Entire group	--	Entire group
Group size	Up to 5	Up to 20	--	Up to 20
Destination rounds	1	Unlimited	Unlimited	Unlimited
AI itinerary	1 generation	Unlimited regen	Full generation	Unlimited
Redos (all AI features)	1 per feature	20	10	Unlimited
Accommodation AI	Vote only	Full comparison	Suggestions	Full comparison
Packing list	Basic (1 redo)	Personalized	Personalized	Personalized + profiles
Sharing (text/PDF)	No	Yes	Yes	Yes
Google Calendar sync	No	Yes	Yes	Yes
Offline access	No	Yes	Yes	Yes
Priority AI	No	Yes	No	Yes

Affiliate Revenue

After the group selects a destination, finalizes an itinerary, or votes on accommodations, surface contextual booking links. This is additive revenue that does not replace or compete with the tier structure.

Affiliate Integration Points

Accommodations: After the group votes on a winning listing, show a "Book this accommodation" button linking to the booking platform (Booking.com, Airbnb) with your affiliate tag.

Activities: Each itinerary activity card can include a "Reserve this activity" link to Viator or GetYourGuide. Viator offers approximately 8% commission on qualifying bookings.

Flights: On the trip dashboard, offer a "Find flights" link to Skyscanner or Google Flights affiliate programs.

Car rental: For road trip or multi-city itineraries, surface a "Rent a car" link through an affiliate like Rentalcars.com or Expedia (up to 4% commission).

Ethics Policy

AI suggestions are ranked by the group's preferences, never by affiliate partnerships. Affiliate options are presented as optional booking shortcuts after the group has already made their decision through voting. This distinction matters for user trust and should be communicated visibly in the product when affiliate links are present.

In the current implementation where users submit their own accommodation links and the AI parses and summarizes them, affiliate bias is structurally impossible since the AI is not discovering or ranking listings. This policy becomes relevant only if GoPackNow later adds AI-driven accommodation or activity discovery.

Margin Analysis

	Pack Plus	Solo Pass	Pro (per trip)
Revenue	\$14.99	\$9.99	~\$10.00*
Store commission (15%)	-\$2.25	-\$1.50	-\$7.50/yr
Net after store	\$12.74	\$8.49	~\$8.50
AI cost per trip	~\$0.15	~\$0.10	~\$0.15

	Pack Plus	Solo Pass	Pro (per trip)
Firebase/infra per trip	~\$0.05	~\$0.03	~\$0.05
Gross profit per trip	~\$12.54	~\$8.36	~\$8.30
Gross margin	~98%	~98%	~98%

**Pro per-trip estimate assumes ~5 trips/year at \$49.99 annual. Actual margin depends on usage. Larger future costs will be user acquisition, store fees, Firebase scaling, Maps API, and customer support, not AI.*

Upgrade Experience

The upgrade prompt appears at the moment the host hits a free-tier limit. This is the highest-intent moment in the entire funnel. The design must feel like unblocking, not upselling.

Trigger Points

- Host attempts a 2nd redo on any AI feature (destination, activity, or packing list)
- Host tries to run a 2nd destination suggestion round
- Host taps PDF export
- Host tries to regenerate the full itinerary a 2nd time
- Host attempts to add a 6th group member

Prompt Design

Keep it to one screen, one button, no feature comparison table. The user already hit the limit, so they know what they're missing. Don't oversell, just unblock them.

Recommended copy:

"Upgrade this Pack -- \$14.99"

"One payment unlocks premium planning for everyone on this trip."

Two buttons: [Upgrade] and [Not now]. No other distractions.

Critical UX Consideration

This prompt appears when a group is actively planning together. Four friends are voting, the host tries to regenerate, and they hit the wall. This moment will either convert extremely well (high motivation, group social pressure to keep planning) or feel hostile (bait-and-switch). The difference is entirely in the tone: "unlock the full experience" versus "you've run out." Frame it as the former.

Technical Implementation (Expo / React Native / TypeScript)

Payment Stack

react-native-iap with Expo config plugin: Wraps both StoreKit (Apple) and Google Play Billing in one API. Ships with TypeScript type definitions for clean integration with the existing typed codebase. Requires an Expo development build (not Expo Go) since IAP uses native modules. Add the config

plugin to `app.config.ts` and run a new dev build via `eas build` or `npx expo prebuild`.

Product setup: Register a consumable in-app purchase (e.g., `com.gopacknow.packplus`) at \$14.99 in both App Store Connect and Google Play Console. Consumable because each trip is a separate purchase.

Server-side validation: Firebase Cloud Function receives the purchase receipt, validates against Apple's `verifyReceipt` or Google's `purchases.products.get` endpoint, then writes `isPremium: true` to the trip node in Firebase Realtime Database. Never trust the client alone for purchase verification.

Real-time unlock: Existing Firebase Realtime Database listeners pick up the `isPremium` flag change instantly. All group members' apps update without additional sync logic. TanStack React Query can invalidate the trip query on the flag change for any cached state.

Restore purchases: Apple requires `getAvailablePurchases()` for reinstalls. Since the premium flag lives on the trip in Firebase (not on device via Async Storage), this is primarily an App Store review requirement. The trip is already marked premium server-side regardless of what the device remembers.

Upgrade prompt UI: Use React Native Reanimated for a smooth modal slide-up when the host hits a free-tier limit. Expo Haptics for a subtle vibration on the upgrade button tap. Expo Blur or Expo Glass Effect for the modal backdrop to keep it consistent with the existing frosted glass design language.

Web vs. Mobile Payment Separation

If you later add Stripe payments on the web (`gopack.now`), you cannot link to or mention the web purchase option inside the iOS app. Apple's guidelines prohibit steering users to external payment methods. The web and mobile payment paths must be completely separate, with Firebase as the shared source of truth for whether a trip is premium regardless of where the purchase was made. Web payments via Stripe retain ~97% of revenue versus ~85% through app stores.

Sharing and Export (Premium Only)

The existing Expo Print and Expo Sharing modules handle PDF generation and native share sheet integration. Gate these behind the `isPremium` flag on the trip. When a free-tier user taps share or export, show the upgrade prompt instead of the share sheet. This is a clean paywall trigger because the user has already completed the planning and wants the output, which is a high-intent moment.

Launch Sequence

Each phase requires validation from the previous one before proceeding. Do not build ahead of proven demand.

Phase 1

First Trip Free

Every new host gets their first complete group trip with full premium features at no cost. This lets users experience the entire product before making a purchase decision. The first trip is the demo. Measure: trip completion rate, feature usage, group size.

Phase 2

Pack Plus at \$14.99

Second trip onward, premium features require the host to purchase Pack Plus. This is where you learn whether people will pay. Measure: conversion rate from free to paid, revenue per user, drop-off at the upgrade prompt.

Phase 3

Price Testing

Test \$9.99, \$14.99, and \$19.99 for Pack Plus. Run each price for a meaningful sample (at least 100 upgrade prompt impressions per price point). Optimize for total revenue (conversion rate multiplied by price), not just conversion rate.

Phase 4

Affiliate Links

Add booking links for accommodations, activities, flights, and car rentals after the group has made their selections. This is additive revenue with zero impact on existing UX. Measure: click-through rate, conversion rate, revenue per trip.

Phase 5

Solo Pass at \$9.99

Build and launch only if real demand is observed from users attempting to use GoPackNow alone. Do not build speculatively. Measure: solo user sign-up attempts, inbound requests.

Phase 6

GoPack Pro at \$49.99/year

Launch only after seeing repeat Pack Plus purchases from the same users. This tier converts repeat buyers into subscribers. Measure: percentage of users purchasing Pack Plus for a 2nd and 3rd trip within 12 months.

Key Risks and Mitigations

Free tier too generous: If the free tier provides enough value for casual travelers (1-2 trips/year), upgrade motivation is low. Mitigation: monitor what percentage of free users hit the single redo limit. The 1-redo cap per AI feature and 5-member group cap are designed to let users experience the core loop fully while creating clear upgrade triggers.

Upgrade prompt feels hostile: A paywall appearing mid-group-planning can feel like bait-and-switch. Mitigation: frame as unlocking, not blocking. Consider showing the upgrade option proactively on the trip dashboard before the host hits a limit, so it doesn't surprise them.

Apple/Google commission erosion: 15-30% store fees reduce per-trip revenue. Mitigation: qualify for the small business program (15% rate under \$1M annual revenue). Long-term, drive web traffic to [gopack.now](#) where Stripe retains ~97%.

Solo Pass cannibalizes group growth: If solo mode is too polished, users who would have invited friends just plan alone. Mitigation: delay Solo Pass until group adoption is strong. Never make solo planning better than the group experience.

AI cost scaling: Current cost is ~\$0.15/trip. If Claude API pricing changes or usage patterns increase (more regenerations, longer itineraries), costs could rise. Mitigation: the per-trip pricing model means revenue scales with usage. Set hard caps on regenerations per tier to bound worst-case AI costs.

Summary

GoPackNow's monetization strategy is built on three principles:

First: the host pays, the group benefits. This aligns the buyer (the organizer with the most pain) with the product, and turns every free group member into a future paying host.

Second: per-trip pricing over subscriptions. It matches how people budget for travel, avoids subscription fatigue, and creates a clean value exchange with no churn risk.

Third: launch sequentially, validate before building. Pack Plus first, then price test, then affiliates, then Solo, then Pro. Each step earns the right to exist based on data from the previous one.

At \$14.99 per trip with ~\$0.15 in AI costs and 15% store commission, the unit economics are strong from day one. The larger future costs will be user acquisition, Firebase scaling, Maps API usage, and support, not the AI itself. The product's group-viral loop (every invited member is a future host) provides organic acquisition that most travel apps lack.
